SNPlocs.Hsapiens.dbSNP155.GRCh38

September 27, 2024

SNPlocs.Hsapiens.dbSNP155.GRCh38 The SNPlocs.Hsapiens.dbSNP155.GRCh38 package

Description

Human SNP locations and alleles extracted from dbSNP Build 155 and placed on the GRCh38/hg38 assembly

Details

The 949,021,448 SNPs in this package were extracted from the RefSNP JSON files for chromosomes 1-22, X, Y, and MT, located at https://ftp.ncbi.nih.gov/snp/archive/b155/JSON/ (these files were created by NCBI in May 2021).

These SNPs are compatible with packages **BSgenome.Hsapiens.NCBI.GRCh38** and **BSgenome.Hsapiens.UCSC.hg38** that is, they can be "injected" in the **BSgenome** objects contained in these packages.

SNP positions and alleles are reported with respect to the *plus* strand.

Only SNPs of type *snv* (*single-nucleotide* variant a.k.a. *single-base substitution*) were kept. Other variant types supported by dbSNP are: *delins* (indel), *ins* (insertion), *del* (deletion), and *mnv* (multiple nucleotide variation). These other variants are NOT included in SNPlocs.Hsapiens.dbSNP155.GRCh38 but are available in the XtraSNPlocs.Hsapiens.dbSNP155.GRCh38 package.

Note

The SNPs in this package can be "injected" in BSgenome. Hsapiens. NCBI.GRCh38 or BSgenome. Hsapiens.UCSC.hg38, and will land at the correct positions.

See ?injectSNPs in the **BSgenome** software package for more information about the SNP injection mechanism.

Examples

```
## -----
## A. BASIC USAGE
## -----
snps <- SNPlocs.Hsapiens.dbSNP155.GRCh38</pre>
snpcount(snps)
seqinfo(snps)
## Get the positions and alleles of all SNPs on chromosomes 22 and MT:
snpsBySeqname(snps, seqnames=c("22", "MT"))
## Get the positions and alleles of all SNPs within some regions:
snpsByOverlaps(snps, GRanges(c("Y:230001-232000", "19:88501-89000")))
## ------
## B. EXTRACT SNP INFORMATION FOR A SET OF RS IDS
## -----
"rs3734153", "rs79381275", "rs1516535", "rs74342513")
## Note that the first call to snpsById() takes a long time but
## subsequent calls are faster.
my_snps <- snpsById(snps, my_rsids)</pre>
my_snps
## Translate the IUPAC ambiguity codes used to represent the alleles
## into nucleotides:
```

IUPAC_CODE_MAP[mcols(my_snps)\$alleles_as_ambig]

------## C. INJECTION IN THE REFERENCE GENOME ## ------

library(BSgenome.Hsapiens.UCSC.hg38)
ref_genome <- BSgenome.Hsapiens.UCSC.hg38
ref_genome</pre>

alt_genome <- injectSNPs(ref_genome, "SNPlocs.Hsapiens.dbSNP155.GRCh38")
alt_genome # note the additional line "with SNPs injected from..."</pre>

alphabetFrequency(ref_genome\$chr22)
alphabetFrequency(alt_genome\$chr22)

Get the number of nucleotides that were modified by this injection: neditAt(ref_genome\$chr22, alt_genome\$chr22) # 12798921
